

# FILIP Professional Service

## Corrective

Where equipment is maintained after a break down occurs. This maintenance is often most expensive because worn equipment can damage other parts and cause multiple damages. This is the most commonly used approach. In most cases, this is costly business. Also if the equipment needs to be replaced, the cost of replacing it alone can be substantial. It is also important to consider health, safety and environment (HSE) issues related to malfunctioning equipment.

## Preventative

Where equipment is maintained before a break down occurs. This type of maintenance is the most effective in preventing age related failures of equipment. For random failure patterns which amount to 80% of the failure patterns, condition monitoring proves to be effective. Preventative maintenance is performed, in an attempt... to avoid failures, unnecessary production loss and safety violations.

## Warranty Submissions

Any "new" industrial sanitary maintenance equipment purchased from RD FILIP Inc. carries a manufacturer's limited warranty and we are equipped to service those items. We may perform service on any industrial equipment under warranty so long as we are an authorized parts and service center of that particular brand. Additionally we are equipped to perform maintenance on any brand of industrial sanitary maintenance equipment.
